 non-commercial use only
 2004 Jan 7

INSTRUCTIONS

Aux depth is 1k (lin)
 Aux speed is 100k (lin)

1. Wire up this board including the Aux Depth, Aux Speed, and Aux LED. Run ground and V+ from main board.
2. Piggyback a wire from "Smooth 3" on this board to the Smoothness pot (lug 3)
3. Change the main "Speed" pot to 100k. For the tremulus, also change "Fine tuning" pot to 10k.
4. Change the main LFO cap from 100uF to 10uF. If there's a rate-doubler mod, change the rate-doubler cap to 10uF also.
5. Change the 100ohm resistor that connects to speed 2 on the main board, to a 2k7
6. Run a wire from "to pin 7..." to pin 7 of the 4558 on the main board. (That is, it connects to the other side of the 2k7 you just installed in step #5)
